### EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Lawrence P. Kessler on 22 June 22, 2004.

The application has been amended as follows.

In claim 1, the phrases "at least" on lines 15-16 and "at least" on line 17 have been deleted.

2. The following is an examiner's statement of reasons for allowance.

The invention as claimed is directed to a fuser member comprising a core and a layer overlying the core. The overlying layer comprises a fluorocarbon random copolymer having subunits as recited in claim 1, a curing agent, and a siloxane polymer comprising one or more curable silanol-terminated polyfunctional poly(C1-6 alkyl)siloxane polymer. The overlying layer further comprises the following components (based on 100 parts of copolymer): 50 to 140 parts by weight of aluminum oxide, 6 parts by weight of calcium hydroxide, and 3 parts by weight of magnesium oxide.

Chen et al. ('823) represents the closest prior art. However, Chen et al. do not teach or fairly suggest a fuser having an overlying layer containing only 6 parts by weight of calcium hydroxide and 3 parts by weight of magnesium oxide per 100 parts of copolymer. Chen et al.

Art Unit: 1773

teach that the overlying layer comprises 25-50 vol% filler composed of aluminum oxide and alkaline earth metal oxide and/or alkaline earth metal hydroxide. The aluminum oxide comprises 20-40 vol% of the layer, therefore, the alkali metal oxide and/or alkali metal hydroxide is 5-10 vol%. Assuming the minimal amount of filler (and thus the maximum amount of copolymer), 5 vol% of magnesium oxide would correspond to about 13.1 parts by weight per 100 parts of copolymer, and 5 vol% of calcium hydroxide would correspond to 8.2 parts by weight per 100 parts of copolymer. In one embodiment, Chen et al. teach an overlying layer composition comprising 3 vol% magnesium oxide, 6 vol% calcium hydroxide, with 20-40 vol% of aluminum oxide. However, this corresponds to about 8.3-11.5 parts by weight of magnesium oxide and 10.4-14.4 parts by weight of calcium hydroxide per 100 parts of copolymer. That is, Chen et al. does not teach a composition comprising 6 parts by weight of calcium hydroxide and 3 parts by weight of magnesium oxide per 100 parts by weight of copolymer. Moreover, Chen et al. do not fair suggest or provide motivation to one skilled in the art to use a combination of calcium hydroxide and magnesium oxide in which the weight (as opposed to volume) of calcium hydroxide used is twice that of the magnesium hydroxide.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
